1 General Description

The GW1NR FPGAs are members of the 1 series of the LittleBee family.. The GW1NR devices are system-in-package chips with memory chips integrated into them based on the GW1N devices, featuring low power, instant-on, low cost, non-volatility, enhanced security, small footprint, various packaging options, and flexible usage, and can be widely used in communication, industrial control, consumer, video surveillance, etc.

GOWINSEMI provides a new generation of FPGA hardware development environment that supports FPGA synthesis, placement & routing, bitstream generation and download, etc.

1.1 Features

- Lower power consumption
 - 55nm embedded flash technology
 - LV: Supports 1.2V core voltage
 - UV: Supports unique power supplies for V_{CC} / V_{CCX} / V_{CCIO}
 - Supports dynamically turning on/off the clock
- User Flash (GW1NR-2/4/9)
 - NOR Flash
 - 10,000 write cycles
 - Greater than 10 years of data retention at +85°C
 - Data width: 32 bits
 - Capacity in GW1NR-2: 96K bits
 - Capacity in GW1NR-4: 256K bits
 - Capacity in GW1NR-9: 608K bits
- Page Erase Capability: 2,048 bytes per page
- Word Program Time: $\leq 16\mu s$
- Page Erase Time: $\leq 120 ms$
- Configuration Flash(GW1NR-2/4/9)
 - NOR Flash
 - 10,000 write cycles
 - Greater than 10 years of data retention at +85°C
- Integrates SDRAM/PSRAM/NOR Flash memory chips
- Hard MIPI D-PHY RX core(GW1NR-2)
 - Supports MIPI DSI and MIPI CSI-2 RX
 - Available on Bank6

- MIPI data rate up to 2Gbps per lane
- Supports up to 4 data lanes and 1 clock lane
- MIPI D-PHY RX/TX Implemented by Using GPIOs
 - Supports MIPI CSI-2 and DSI RX/TX with a data rate of up to 1.2Gbps per lane
 - Three IO types are available: TLVDS, ELVDS, and MIPI IO
- Multiple I/O standards
 - LVCMOS33/25/18/15/12; LVTTL33, SSTL33/25/18 I, SSTL33/25/18 II, SSTL15; HSTL18 I, HSTL18 II, HSTL15 I; PCI, LVDS25, RSDS, LVDS25E, BLVDSE, MLVDSE, LVPECLE, RSDSE
 - Input hysteresis options
 - Drive strength options
 - Individual Bus Keeper, Pull-up/Pull-down, and Open Drain options
 - Hot socketing
- High-performance DSP blocks(GW1NR-4/9)
 - High-performance digital signal processing
 - Supports 9 x 9, 18 x 18, 36 x 36 bit multipliers and 54-bit accumulators
 - Supports cascading of multipliers
- Supports pipeline mode and bypass mode
- Pre-addition operation for the filter function
- Supports barrel shifters
- Abundant basic logic cells
 - 4-input LUTs (LUT4s)
 - Supports shift registers and shadow SRAMs
- Block SRAMs with multiple modes
 - Supports Dual Port mode, Single Port mode, and Semi-Dual Port mode
 - Supports byte-enable
- Flexible PLLs
 - Frequency adjustment (multiplication and division) and phase adjustment
 - Supports global clocks
- Built-in Flash programming
 - Instant-on
 - Supports security bit operation
 - Supports AUTO BOOT and DUAL BOOT
- Configuration
 - JTAG configuration
 - Supports JTAG background upgrade
 - Supports up to seven GowinCONFIG configuration modes: AUTOBOOT, SSPI, MSPI, CPU, SERIAL, DUAL BOOT, I2C Slave

Note!

- ^[1] The pinout of balls C1/C2/D2/F1/F9/A7/A6 of MG100PF has been adjusted based on MG100P.
- ^[2] GW1NR-2 in the MG49P/MG49PG/MG49G packages only supports the I²C configuration mode and AUTO BOOT configuration mode. When I²C mode is supported, the SDA and SCL pins need to be externally pulled up.
- The package types in this manual are referred to by acronyms, see [4.1Part Naming](#) for more information.
- For more information, see [UG805, GW1NR-2 Pinout](#), [UG116, GW1NR-4 Pinout](#), and [UG803, GW1NR-9 Pinout](#).
- JTAGSEL_N and JTAG pins cannot be used as GPIOs simultaneously. However, when mode [2:0] = 001, the JTAGSEL_N pin is always a GPIO, in other words the JTAGSEL_N pin and the four JTAG pins (TCK, TMS, TDI, TDO) can be used as GPIOs simultaneously. See [UG119, GW1NR series of FPGA Products Package and Pinout](#) for more details.

2Architecture

2.1 Architecture Overview

Figure 2-1 Architecture Overview of GW1NR-4

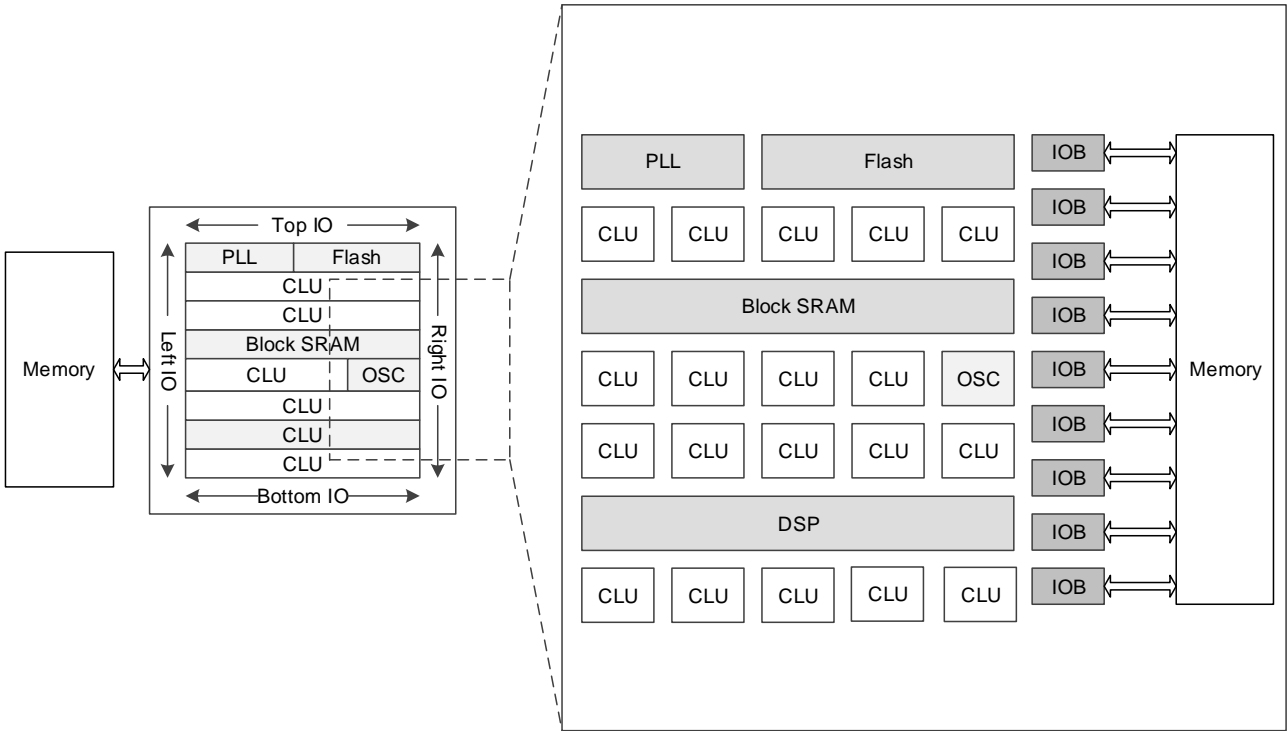

Figure 2-2 Architecture Overview of GW1NR-9

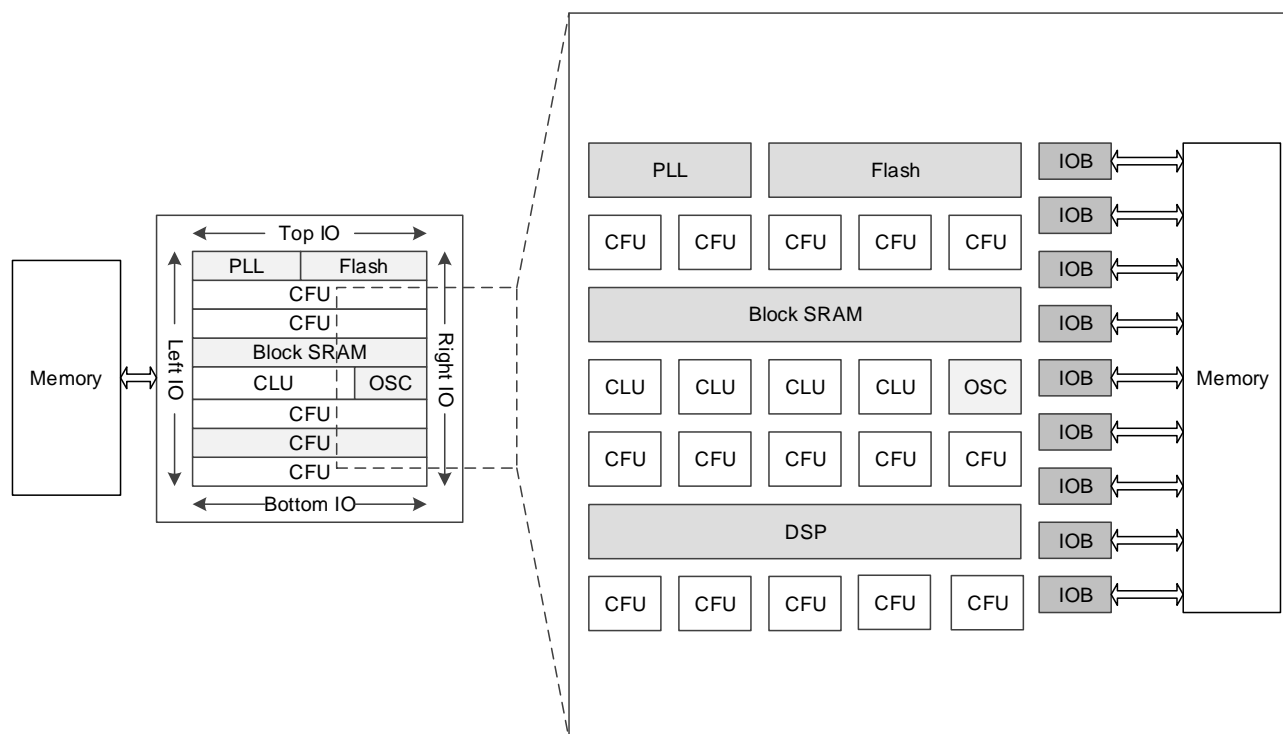

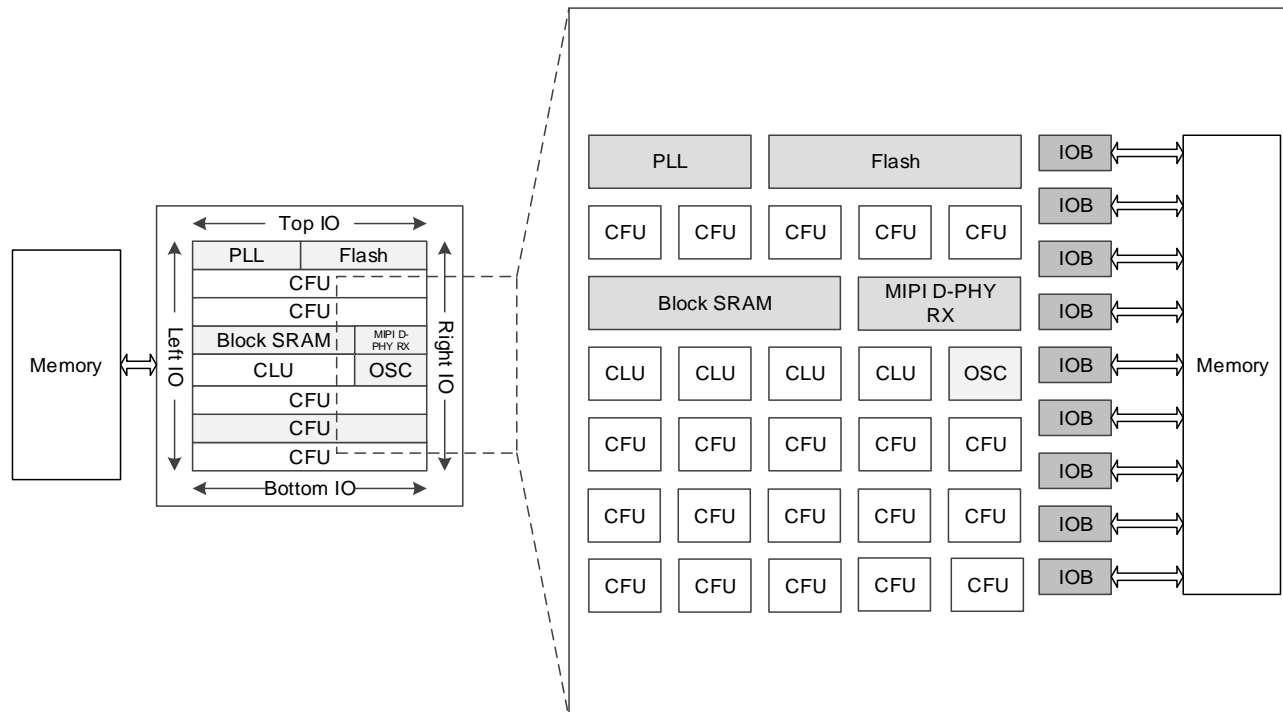

Figure 2-3 Architecture Overview of GW1NR-2

As shown in Figure 2-1 to Figure 2-3, the GW1NR device is a system-in-package (SiP) chip that combines the GW1N device and a memory chip. For the features of the memory chips, please refer to [2.2 Memory](#). As shown in Figure 2-3, the GW1NR-2 device is further

embedded with a hard MIPI PHY RX core compared with other GW1NR devices. See Table 1-1 for more information on the resources provided.

The core of the GW1NR device is an array of logic cells surrounded by IO blocks. Besides, BSRAMs, DSP blocks, PLLs, an on-chip oscillator, and Flash resources allowing for instant-on are provided. See Table 1-1 for more information on the resources provided.

The Configurable Function Unit (CFU) and the Configurable Logic Unit (CLU) are the two kinds of basic logic blocks that form the core of Gowin FPGAs. Devices with different capacities have different numbers of rows and columns of CFUs/CLUs. See [2.3 Configurable Function Units](#) for more information.

The I/O resources in the GW1NR series of FPGA products are arranged around the periphery of the devices in groups referred to as banks. Some of the I/O resources are connected to the memory chip for data storage, and some of the I/O resources are bonded out. The I/O resources support multiple I/O standards and can be used for regular mode, SDR mode, and generic DDR mode. See [2.4 Input/Output Blocks](#) for more information.

BSRAMs are arranged in row(s) inside the GW1NR series of FPGA products. Each BSRAM has a capacity of 18Kbits and supports multiple configuration modes and operation modes. See [2.5 Block SRAM](#) for more information.

GW1NR-2, GW1NR-4, and GW1NR-9 feature embedded Flash resources with capacities of 1 Mbits, 2 Mbits, and 4 Mbits respectively. The Flash memory resources consist of configuration Flash resources and user Flash resources. Configuration Flash resources are used for internal Flash programming, see [2.12 Programming & Configuration](#) for more information. User Flash resources are used for user storage, see [2.6 User Flash \(GW1NR-2/4/9\)](#) for more information.

The GW1NR series of FPGA products provide DSP blocks. Each DSP block contains two macros, and each macro contains two pre-adders, two 18 x 18 bit multipliers, and one three-input ALU. See [2.7 Digital Signal Processing](#) for more information.

Note!

GW1NR-2 does not support DSP resources currently.

The GW1NR series of FPGA products have embedded PLL resources. The PLLs can provide synthesizable clock frequencies. Frequency adjustment (multiplication and division), phase adjustment, and duty cycle adjustment can be realized by configuring the parameters. These FPGAs have an embedded programmable on-chip clock oscillator that supports clock frequencies ranging from 2.5 MHz to 105MHz, providing clocking resources for the MSPI mode. It provides an MSPI clock source for the MSPI configuration mode with a tolerance of $\pm 5\%$. See [2.9 Clocks](#) and [2.13 On-chip Oscillator](#) for more information.

The GW1NR-2 device contains a hard MIPI D-PHY RX core, see [2.8.1 Hard MIPI D-PHY RX core\(GW1NR-2\)](#) for more information.

There are also abundant Configurable Routing Units (CRUs) that interconnect all the resources within the FPGA. For example, routing resources distributed in CFUs and IOBs interconnect resources in them. Routing resources can be automatically generated by the Gowin software. In addition, the GW1NR series of FPGA products also provide abundant dedicated clock resources, long wires (LWs), global set/reset (GSR) resources, programming options, etc. See [2.9 Clocks](#), [2.10 Long Wires](#), [2.11 Global Set/Reset](#) for more information.

2.2 Memory

The GW1NR series of FPGA products in different packages have different capacities and types of memory. Please refer to [1.3 Package Information](#) for more information.

2.2.1 SDR SDRAM

Features

- Access time: 4.5ns/5.4ns
- Clock frequency: 200MHz
- Data width: 16bits
- Synchronous Operation
- Internal pipelined architecture
- Four internal banks (1M x 16 bits x 4 banks)
- Programmable mode
 - Column address strobe latency: 2 or 3
 - Burst lengths: 1, 2, 4, 8, or full page
 - Burst type: sequential mode or interleaved mode
 - Burst-Read-Single-Write
 - Burst stop function
- Byte masking function
- Auto refresh and self refresh
- 4,096 refresh cycles/64 ms
- 3.3V±0.3V power supply^[1]
- LVTTTL Interface

Note!

[1] For more information about the power supply, please refer to Table 3-1 Absolute Max. Ratings.

Overview

The SDRAM integrated in the GW1NR series of FPGA Products is a high-speed CMOS synchronous DRAM with a capacity of 64M bits. The SDRAM consists of four banks with each bank containing 1M x16 bits.

Each bank is organized as 4096 rows x 256 columns x 16 bits. Burst accesses are supported. Accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an Activate command, which is then followed by a Read or Write command. The SDRAM provides read or write burst lengths of 1, 2, 4, 8, or full page, with a burst termination option. An auto pre-charge function may be enabled to provide a self-timed row pre-charge that is initiated at the end of the burst sequence. Both the auto-refresh and self-refresh functions are easy to use. Besides, by using a programmable mode register, the system can choose the most suitable modes to maximize its performance.

The supply voltage for the SDRAM interface is 3.3V, and the I/O Bank voltage that connects to the SDRAM needs to be 3.3V. For more details, please refer to Table 3-2.

The IP Core Generator integrated in the Gowin Software supports a SDR SDRAM controller IP that can interface to both embedded and external SDRAMs. This controller IP can be used for the SDRAM power-up initialization, activation, auto-refresh, etc. For more information, please refer to [IPUG279, Gowin SDRAM Controller User Guide](#).

2.2.2 PSRAM

The features immediately below apply to the MG81P, QN88P, LQ144P, MG100P, MG100PF, MG100PT, and MG100PS packages.

Features

- Clock frequency: 166 MHz
- 32Mb capacity for each PSRAM
- Double Data Rate
- Data width: 8 bits
- Read-write data strobe (RWDS)
- Temperature compensated refresh
- Partial array self-refresh (PASR)
- Hybrid sleep mode
- Deep power down(DPD)
- Drive strengths: 35, 50, 100, and 200 Ohm
- Burst access
- Burst lengths: 16/32/64/128
- Status/control registers
- 1.8V power supply^[1]

The features immediately below apply to the MG100PA, MG49P, and MG49PG packages.

Features

- Clock rate up to 233MHz, 466MB/s read/write throughput
- 32Mb storage space each
- Partial array self-refresh (PASR)
- Data Masking (DM) for write operations
- Write burst lengths: maximum 1024 bytes, minimum 2 bytes

Note!

[1] For more information on the power supply, see [UG805, GW1NR-2 Pinout](#), [UG116, GW1NR-4 Pinout](#), [UG803, GW1NR-9 Pinout](#).

The supply voltage for the PSRAM interface is 1.8V, and the I/O Bank voltage that connects to the PSRAM needs to be 1.8V. For more details, please refer to Table 3-2.

The IP Core Generator integrated in the Gowin Software supports a PSRAM controller IP that can interface to both embedded and external PSRAMs. This controller IP can be used for the PSRAM power-up initialization, read calibration, etc. For more information, please refer to [IPUG767, Gowin UHS PSRAM Memory Interface & 2CH IP User Guide](#) and [IPUG943, Gowin PSRAM Memory Interface HS & HS 2CH IP User Guide](#).

2.2.3 NOR Flash

Features

- 4M bits of storage, 256 bytes per page
- Supports SPI
- Clock frequency
 - Dual output data transfer up to 160Mbits/s ~ 100MHz (3.0V~3.6V)
 - Dual output data transfer up to 120Mbits/s ~ 70MHz (2.1V~3.0V)
 - Dual output data transfer up to 80Mbits/s ~ 50MHz (1.65V~2.1V)
- Software/Hardware Write Protection:
 - Entire/partial write protection via software settings
 - Top/bottom block protection
- Minimum 100,000 program/erase cycles
- Fast program/erase operations:
 - Page program time: 1.6ms
 - Sector erase time: 150ms
 - Block erase time: 0.5s/0.8s
 - Chip erase time: 6s/3s
- Flexible Architecture:
 - Sector: 4K bytes

- Block: 32/64K bytes
- Lower power consumption:
 - Stand-by current: 0.1uA
 - Power down current: 0.1uA
- Security Features
 - 128-bit unique ID for each device
- Data retention: 20 years

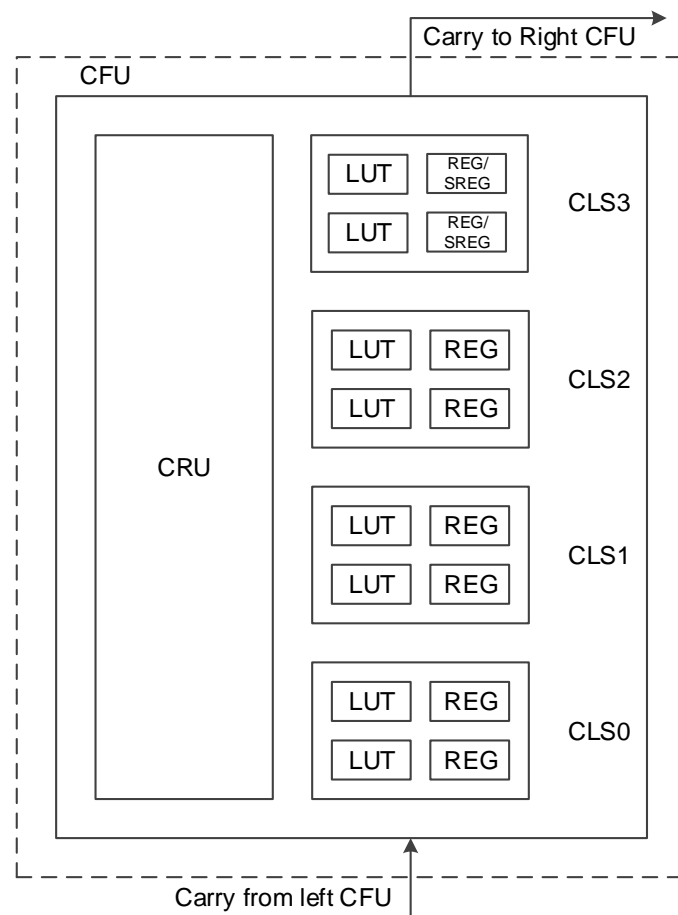

Gowin provides a universal SPI NOR Flash Interface IP allowing for interconnection with the SPI NOR Flash chip. For more information, see [IPUG945, Gowin SPI Nor Flash Interface IP User Guide](#).

2.3 Configurable Function Units

Configurable Function Units (CFUs) and/or Configurable Logic Units (CLUs) are the basic cells for the core of GOWINSEMI FPGA Products. Each basic cell consists of four Configurable Logic Sections (CLSs) and their routing resource Configurable Routing Units (CRUs). Each of the three CLSs contains two 4-input LUTs and two registers, and the other one only contains two 4-input LUTs, as shown in Figure 2-4 .

The CLSs in the CLUs cannot be configured as SRAMs, but can be configured as basic LUTs, ALUs, and ROMs. The CLSs in the CFUs can be configured as basic LUTs, ALUs, SRAMs, and ROMs according to application scenarios.

For more information on the CFUs, see [UG288, Gowin Configurable Function Unit \(CFU\) User Guide](#).

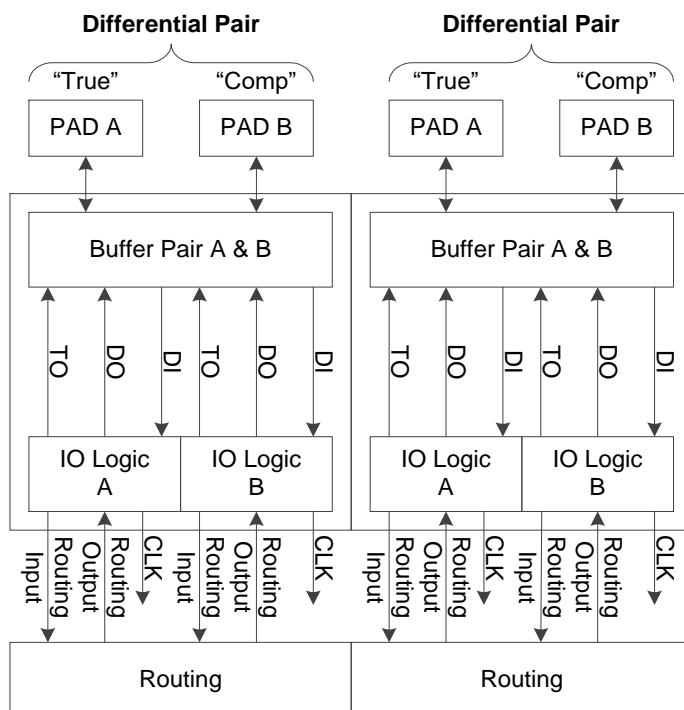

Figure 2-4 CFU Structure View**Note!**

The SREGs need special patch support. Please contact Gowin's technical support or local office for this patch.

2.4 Input/Output Blocks

The Input/Output Block (IOB) in the GW1NR series of FPGA products consists of a buffer pair, IO logic, and corresponding routing units. As shown below, each IOB connects to two pins (marked as A and B), which can be used as a differential pair or as two single-ended inputs/outputs.

Figure 2-5 IOB Structure View

The features of the IOB include:

- V_{CCIO} supplied with Each bank
- LVCMOS, PCI, LVTTTL, LVDS, SSTL, HSTL, etc.
- Input hysteresis options
- Drive strength options
- Individual Bus Keeper, Pull-up/Pull-down, and Open Drain options
- Hot socketing
- IO logic supports basic mode, SDR mode, DDR mode, etc.

For more information on the IOBs, see [UG289, Gowin Programmable IO User Guide](#).

2.4.1 I/O Standards

There are four banks in the GW1NR-4/9 devices, as shown in Figure 2-6. There are seven banks in the GW1NR-2 device, of which Bank6^[1] is a dedicated MIPI Bank for MIPI D-PHY RX, as shown in Figure 2-7. Each bank has its own I/O power supply V_{CCIO} .

To support SSTL, HSTL, etc., Each bank also has one independent voltage source (V_{REF}) as the reference voltage. You can choose to use the internal V_{REF} ($0.5 \times V_{CCIO}$) or the external V_{REF} input via any IO from the bank.

Note!

^[1] If the MIPI function is not used, the pins of Bank6 can be left floating. Bank6 can also be used for differential inputs (with common mode voltage $\leq 0.5V$) by bypassing the MIPI logic.

Figure 2-6 I/O Bank Distribution View of GW1NR-4/9

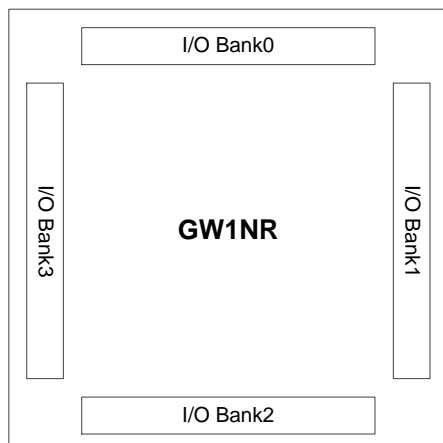

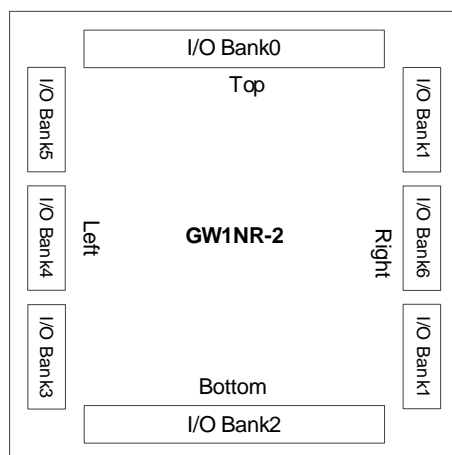

Figure 2-7 I/O Bank Distribution View of GW1NR-2

The GW1NR series of FPGA products support LV version and UV version.

The LV version devices support 1.2V V_{CC} for low power consumption.

V_{CCIO} can be set to 1.2V, 1.5V, 1.8V, 2.5V, or 3.3V as needed.

The UV version devices support 1.8V, 2.5V, and 3.3V V_{CC} , and a linear voltage regulator is integrated to facilitate a single power supply.

V_{CCX} supports 1.8V, 2.5V, or 3.3V.

The GPIOs of the GW1NR series of FPGA products support MIPI IO mode, see Table 2-9 for more details.

Note!

- During configuration, all GPIOs of the device are high-impedance with internal weak pull-ups. After the configuration is complete, the I/O states are controlled by user programs and constraints. The states of configuration-related I/Os differ depending on the configuration mode.
- For the recommended operating conditions of different devices, please refer to [3.1 Operating Conditions](#).

For the V_{CCIO} requirements of different I/O standards see Table 2-1 and Table 2-2.

Note!

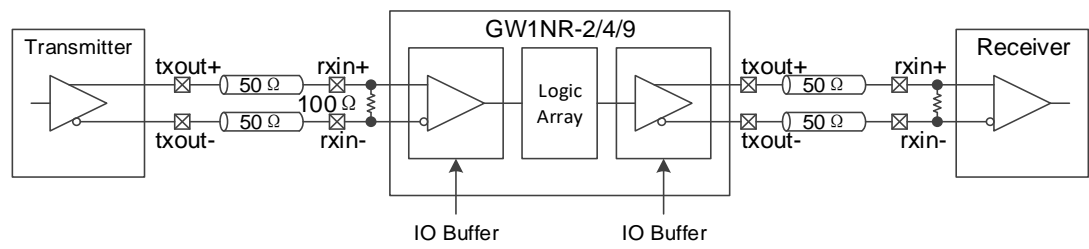

- ^[1] Bank2 of GW1NR-2, Bank6 (Hard core) of GW1NR-2, and Bank0 of GW1NR-9 support MIPI I/O input.
- ^[2] The LVC MOS12 standard can be implemented with LVC MOS12, LVC MOS12UD15, VCMOS12UD18, LVC MOS12UD25, and LVC MOS12UD33 I/O types, which support different VCCIO. The same is true for the LVC MOS15/LVC MOS18/LVC MOS25/LVC MOS33 standards.
- ^[3] OD=over drive, UD=under drive. When using the OD/UD types, you need to set the Pull Mode of the corresponding IO to NONE and the PCI Clamp of the corresponding IO to OFF.

2.4.2 True LVDS Design

BANK1/2/3 of the GW1NR series of FPGA products support true LVDS output. In addition, BANK0/1/2/3 support LVDS25E, MLVDS25E, BLVDS25E, etc.

For more information about true LVDS, see [UG805, GW1NR-2 Pinout](#), [UG116, GW1NR-4 Pinout](#), [UG803, GW1NR-9 Pinout](#).

True LVDS input needs a 100Ω termination resistor, see Figure 2-8 for the reference design. Specific banks of the GW1NR series of FPGA products(Automotive) support programmable on-chip 100Ω input differential termination resistors, see [UG289, Gowin Programmable IO User Guide](#).

Figure 2-8 True LVDS Design

For information about termination for LVDS25E, MLVDS25E, and BLVDS25E, please refer to [UG289, Gowin Programmable IO User Guide](#).

2.4.3 I/O Logic

Figure 2-9 shows the I/O logic input and output of the GW1NR series of FPGA products.

Figure 2-9 I/O Logic Input and Output

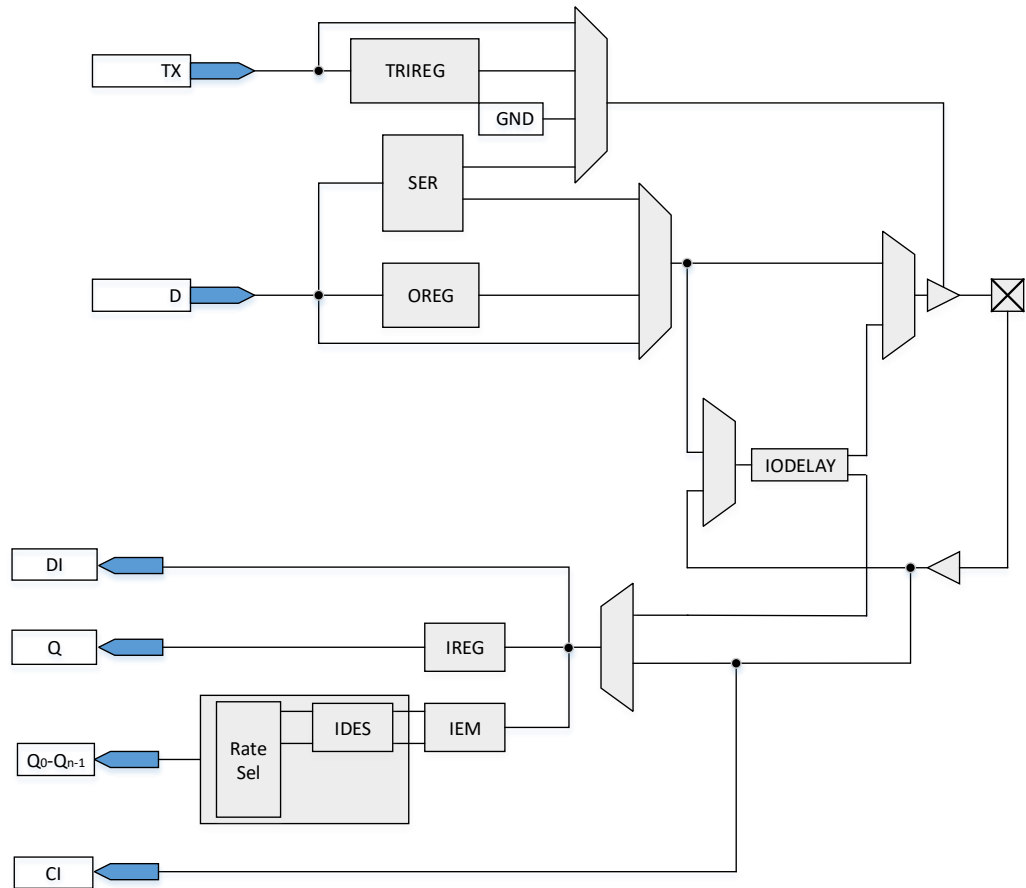

Table 2-3 Port Description

Port	I/O	Description
CI ^[1]	Input	GCLK input signal. For the number of GCLK input signals, please refer to UG805, GW1NR-2 Pinout , UG116, GW1NR-4 Pinout , and UG803, GW1NR-9 Pinout .
DI	Input	IO port low-speed input signal input into the fabric directly.
Q	Output	IREG output signal in the SDR module.
Q0-Q _{n-1}	Output	IDES output signal in the DDR module.

Note!

When CI is used as GCLK input, DI, Q, and Q0-Q_{n-1} cannot be used as I/O input and output.

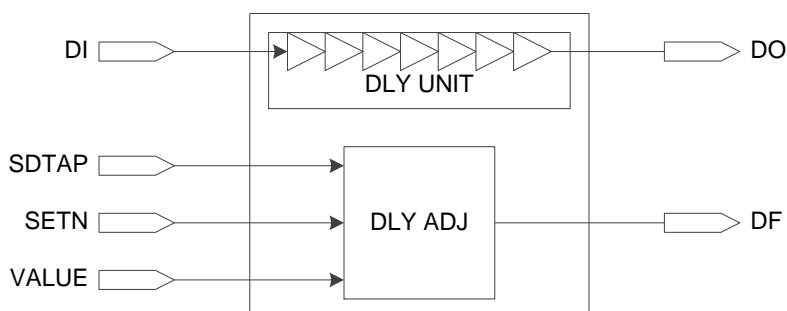

Descriptions of the I/O logic modules of the GW1NR series of FPGA products are presented below.

IODELAY

See Figure 2-10 for an overview of the IODELAY module. Each I/O of the GW1N series of FPGA products contains the IODELAY module, through which you can add additional delays to the I/O to adjust the delay of the signal. The delay time of each step is $T_{dlyunit}$, and the number of steps is DLYSTEP. The total delay time of IODELAY can be calculated as follows: $T_{totldy} = T_{dlyoffset} + T_{dlyunit} * DLYSTEP$. See Table 2-3 for the total delay time.

Table 2-4 Total Delay of IODELAY Module

	Min.	Typ.	Max.
$T_{dlyoffset}$	450 ps	500 ps	550 ps
$T_{dlyunit}$	-	30 ps	-
DLYSTEP	0	-	127

Figure 2-10 IODELAY Diagram

There are two ways to control the delay:

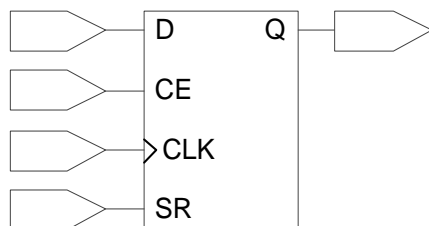

- Static control.

- Dynamic control: can be used with the IEM module to adjust the dynamic sampling window. The IODELAY module cannot be used for both input and output at the same time.

I/O Register

See Figure 2-11 for the I/O register in the GW1NR series of FPGA products. Each I/O provides one input register (IREG), one output register (OREG), and one tristate register (TRIREG).

Figure 2-11 I/O Register Diagram

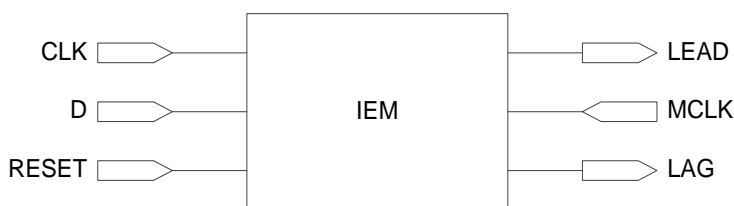

Note!

- CE can be programmed as either active low (0: enable) or active high (1: enable).
- CLK can be programmed as either rising edge triggering or falling edge triggering.
- SR can be programmed as either synchronous/asynchronous SET/RESET or disabled.
- The register can be programmed as a register or a latch.

IEM

The IEM(Input Edge Monitor) module is used to sample data edges and is used in generic DDR mode, as shown in Figure 2-12.

Figure 2-12 IEM Diagram

DES

This series of FPGA products provide a simple deserializer(DES) for input I/O logic to support advanced I/O protocols.

SER

This series of FPGA products provide a simple serializer(SER) for output I/O logic to support advanced I/O protocols.

2.4.4 I/O Logic Modes

The I/O Logic of the GW1NR series of FPGA products supports several operation modes. In each operation mode, the I/O (or I/O differential pair) can be configured as output, input, INOUT or tristate output (output signal with tristate control).

All pins of GW1NR-9 support I/O logic. The pins of GW1NR-4(except IOL10(A, B,C....J) and IOR10(A,B,C....J)) support IO logic. The pins of GW1NR-2(except IOT2(A, B), IOT3A) support IO logic.

2.5 Block SRAM

2.5.1 Introduction

The GW1NR series of FPGA products provide abundant block SRAM resources. These memory resources are distributed as blocks throughout the FPGA array in the form of rows. Therefore, they are called block static random access memories (BSRAMs). The capacity of each BSRAM can be up to 18,432 bits (18K bits). There are four operation modes: Single Port mode, Dual Port mode, Semi-Dual Port mode, and ROM mode.

An abundance of BSRAM resources provide a guarantee for the user's high-performance design. The features of BSRAMs include:

- Up to 18,432 bits per BSRAM
- Clock frequency up to 190MHz
- Supports Single Port mode
- Supports Dual Port mode
- Supports Semi-Dual Port mode
- Provides parity bits
- Supports ROM Mode
- Data widths from 1 to 36 bits
- Mixed clock mode
- Mixed data width mode
- Byte Enable function for 2-byte and above data widths
- Normal read and write
- Read-before-write
- Write-through

2.5.2 BSRAM Configuration Modes

BSRAMs in the GW1NR series of FPGA products support various data widths, see Table 2-5.

Table 2-5 BSRAM Size Configuration^[3]

Single Port Mode	Dual Port Mode ^[1]	Semi-Dual Port Mode	ROM Mode ^[2]
16K x 1	16K x 1	16K x 1	16K x 1
8K x 2	8K x 2	8K x 2	8K x 2
4K x 4	4K x 4	4K x 4	4K x 4
2K x 8	2K x 8	2K x 8	2K x 8
1K x 16	1K x 16	1K x 16	1K x 16
512 x 32	-	512 x 32	512 x 32
2K x 9	2K x 9	2K x 9	2K x 9
1K x 18	1K x 18	1K x 18	1K x 18
512 x 36	-	512 x 36	512 x 36

Note!

- ^[1] For the GW1NR-9 devices, only the C version supports dual port mode.
- ^[2] For the GW1NR-4 devices, only the D version supports ROM mode.
- ^[3] The BSRAM of C version GW1NR-9 does not support data widths of 1 bit and 2 bits.

Single Port Mode

The single port mode supports 2 read modes (Bypass mode and Pipeline mode) and 3 write modes (Normal mode, Write-Through mode, and Read-before-Write mode). In single port mode, writing to or reading from one port at one clock edge is supported. During the write operation, the written data will be transferred to the output of the BSRAM. When the output register is bypassed, the new data will show up at the same write clock rising edge.

For more information on single port mode, please refer to [UG285, Gowin BSRAM & SSRAM User Guide](#).

Dual Port Mode

The dual port mode supports 2 read modes (Bypass mode and Pipeline mode) and 2 write modes (Normal mode and Write-Through mode). The applicable operations are as follows:

- Two independent read operations
- Two independent write operations
- An independent read operation and an independent write operation

Note!

Performing read and write operations to the same address at the same time is not allowed.

For more information on dual port mode, please refer to [UG285, Gowin BSRAM & SSRAM User Guide](#).

Semi-Dual Port Mode

The semi-dual port mode supports 2 read modes (Bypass mode and Pipeline mode) and 1 write mode (Normal mode). Semi-dual port mode supports simultaneous read and write operations in the form of writing to port A and reading from port B.

Note!

Performing read and write operations to the same address at the same time is not allowed.

For more information on semi-dual port mode, please refer to [UG285, Gowin BSRAM & SSRAM User Guide](#).

ROM Mode

BSRAMs can be configured as ROMs. The ROM can be initialized during the device configuration stage, and the ROM data needs to be provided in the initialization file. Initialization is completed during the device power-on process.

Each BSRAM can be configured as one 16Kbits ROM. For more information on ROM mode, please refer to [UG285, Gowin BSRAM & SSRAM User Guide](#).

2.5.3 Mixed Data Width Configuration

The BSRAMs in the GW1NR series of FPGA products support mixed data width operations. In dual port mode and semi-dual port mode, the data widths for read and write can be different, see Table 2-6 and Table 2-7.

Table 2-6 Dual Port Mixed Read/Write Data Width Configuration^{[1],[2]}

Read Port	Write Port

2.5.4 Byte-enable

BSRAMs support the byte-enable function. For data longer than a byte, the additional bits can be blocked, allowing only the selected portion to be written into the memory. The blocked bits will be retained for future operation. Read/write enable ports (WREA, WREB) and byte-enable parameter options can be used to control the BSRAM write operation.

Note!

For the GW1NR series, only GW1NR-2, GW1NR-2B, GW1NR-2C, and GW1NR-4D support the byte-enable function.

2.5.5 Parity Bit

There are parity bits in BSRAMs. The 9th bit in each byte can be used as a parity bit to check the correctness of data transmission. It can also be used for data storage.

2.5.6 Synchronous Operation

- All the input registers of BSRAMs support synchronous write.
- The output registers can be used as pipeline registers to improve design performance.
- The output registers are bypass-able.

2.5.7 BSRAM Operation Modes

The BSRAM supports five different operations, including two read modes (Bypass mode and Pipeline mode) and three write modes (Normal mode, Write-Through mode, and Read-before-Write mode).

Read Mode

The following two read modes are supported.

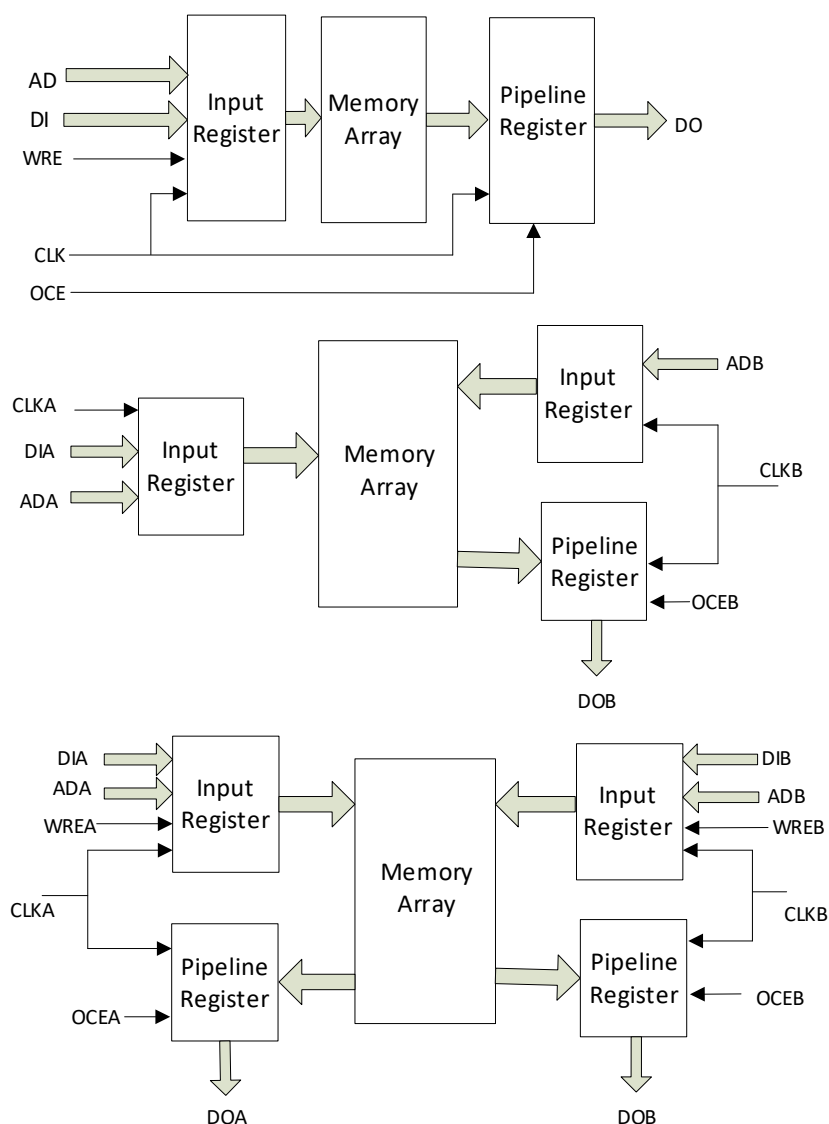

PIPELINE MODE

When a synchronous write cycles into a memory array with pipeline registers enabled, the data can be read from pipeline registers in the next clock cycle. The data bus can be up to 36 bits in this mode.

BYPASS MODE

When a synchronous write cycles into a memory array with pipeline registers bypassed, the outputs are registered at the memory array.

Figure 2-13 Pipeline Mode in Single Port Mode, Dual Port Mode, and Semi-dual Port Mode

Write Mode

NORMAL MODE

In this mode, when you write data to one port, the output data of this port does not change. The written data will not appear at the read port.

WRITE-THROUGH MODE

In this mode, when you write data to one port, the written data will appear at the output of this port.

READ-BEFORE-WRITE MODE

In this mode, when you write data to one port, the written data will be stored in the memory according to the address, and the original data in this address will appear at the output of this port.

2.5.8 Clock Mode

Table 2-8 lists the clock modes in different BSRAM modes:

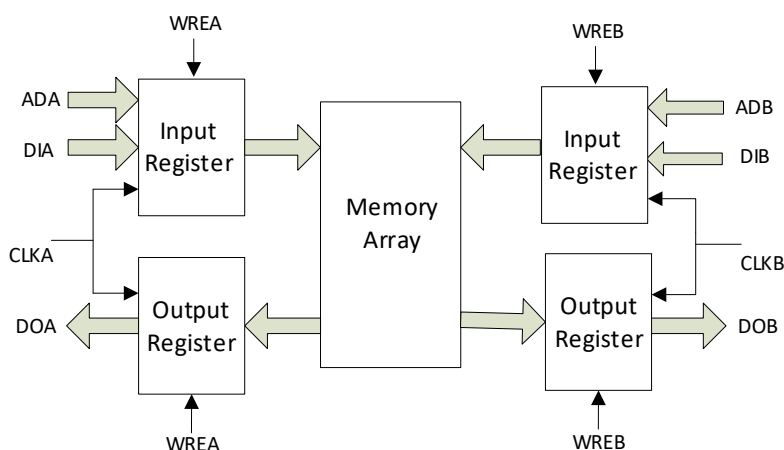

Table 2-8 Clock Modes in Different BSRAM Modes

Clock Mode	Dual Port Mode	Semi-Dual Port Mode	Single Port Mode
Independent Clock Mode	Yes	No	No
Read/Write Clock Mode	Yes	Yes	No
Single Port Clock Mode	No	No	Yes

Independent Clock Mode

Figure 2-14 shows the independent clock operation in dual port mode with one clock at each port. CLKA controls all the registers at Port A; CLKB controls all the registers at Port B.

Read/Write Clock Mode

Figure 2-15 shows the read/write clock operation in semi-dual port mode with one clock at each port. The write clock (CLKA) controls data inputs, write addresses and read/write enable signals of Port A. The read clock (CLKB) controls data outputs, read addresses, and read enable signals of Port B.

2.6 User Flash (GW1NR-2/4/9)

The capacity of the User Flash in GW1NR-2 is 96Kbits. The capacity of the User Flash in GW1NR-4 is 256Kbits. The capacity of the User Flash in GW1NR-9 is 608Kbits. The User Flash consists of row memories and column memories. One row memory consists of 64 column memories. The capacity of one column memory is 32 bits, and the capacity of one row memory is $64 \times 32 = 2048$ bits. Page erase is supported, and the capacity of one page is 2048 bytes, that is, one page contains 8 rows. The key features include:

- NOR Flash
- 10,000 write cycles
- Greater than 10 years of data retention at +85°C
- Data width: 32 bits
- Capacity in GW1NR-2 : 48 rows x 64 columns x 32 = 96K bits
- Capacity in GW1NR-4 : 128 rows x 64 columns x 32 = 256K bits
- Capacity in GW1NR-9 : 304 rows x 64 columns x 32 = 608K bits
- Page erase capability: 2,048 bytes per page
- Fast Page Erase/Word Program Operation

- Clock frequency: 40 MHz
- Word Program Time: $\leq 16\mu\text{s}$
- Page Erase Time: $\leq 120\text{ ms}$
- Current
 - Read current/duration: 2.19mA/25ns (V_{CC}) & 0.5mA/25ns (V_{CCX})(MAX)
 - Program/erase operation: 12/12mA(MAX)

For more information about the User Flash, please refer to [UG295, Gowin User Flash User Guide](#). For the correspondence between User Flash primitives and devices supported, please refer to Table 3-1 Devices Supported of [UG295, Gowin User Flash User Guide](#).

2.7 Digital Signal Processing

2.7.1 Introduction

GW1NR-4/9 provide abundant DSP resources. Gowin's DSP solutions can address high-performance digital signal processing needs such as FIR and FFT designs. The DSP resources have the advantages of stable timing performance, high resource utilization, and low power consumption.

The DSP resources offer the following functions:

- Multipliers with three widths: 9-bit, 18-bit, 36-bit
- 54-bit ALU
- Multipliers cascading to support wider data widths
- Barrel shifters
- Adaptive filtering through signal feedback
- Computing with options to round to a positive number or a prime number
- Supports pipeline mode and bypass mode.

2.7.2 Macro

The DSP blocks are distributed throughout the FPGA array in the form of rows. Each DSP block contains two macros, and each macro contains two pre-adders, two 18 x 18 bit multipliers, and one three-input ALU.

Pre-adder

Each DSP macro contains two pre-adders for implementing pre-addition, pre-subtraction, and shifting.

The pre-adders are located at the first stage and have two input ports:

- Parallel 18-bit input B or SBI;
- Parallel 18-bit input A or SIA.

Note!

Each input port supports pipeline mode and bypass mode.

Gowin's pre-adders can be used independently as function blocks, which support 9-bit and 18-bit widths.

Multiplier

The multipliers are located after the pre-adders. The multipliers can be configured as 9 x 9, 18 x 18, 36 x 18, or 36 x 36. Register mode and bypass mode are supported in both input and output ports. The configuration modes that a macro supports include:

- One 18 x 36 multiplier
- Two 18 x 18 multipliers
- Four 9 x 9 multipliers

Note!

Two macros can form one 36 x 36 multiplier.

Arithmetic Logic Unit

Each DSP macro contains one 54-bit ALU, which can further enhance multipliers' functions. Register mode and bypass mode are supported in both input and output ports. The functions include:

- Addition/subtraction operations of multiplier output data/0, data A, and data B
- Addition/subtraction operations of multiplier output data/0, data B, and carry C
- Addition/subtraction operations of data A, data B, and carry C

2.7.3 DSP Operation Modes

- Multiplier mode
- Multiply accumulator mode
- Multiply-add accumulator mode

For more information on the DSP resources, see [UG287, Gowin Digital Signal Processing \(DSP\) User Guide](#).

2.8 MIPI D-PHY

2.8.1 Hard MIPI D-PHY RX core(GW1NR-2)

GW1NR-2 provides a hard MIPI D-PHY RX core that supports the "MIPI Alliance Standard for D-PHY Specification(Version 2.1)". The dedicated D-PHY core supports MIPI DSI and CSI-2 mobile video interfaces for cameras and displays. The key features include:

- Supports unidirectional high-speed (HS) mode at up to 8Gbps per quad(four data lanes)
- Supports up to 4 data lanes and 1 clock lane
- Supports bidirectional low-power (LP) mode at up to 10Mbps per lane

- Supports built-in HS Sync, bit and lane alignment
- Supports MIPI D-PHY RX 1:8 and 1:16 deserialization modes
- Supports MIPI DSI and MIPI CSI-2 link layers
- Available on Bank6

For more information, see [IPUG778, Gowin GW1N-2 Hardened MIPI D-PHY RX User Guide](#).

2.8.2 MIPI D-PHY RX/TX Implemented by Using GPIOs

When implementing soft MIPI D-PHY RX/TX with GPIOs, three IO types are available: TLVDS, ELVDS, and MIPI IO.

All GW1NR FPGAs support the TLVDS/ELVDS types. To implement MIPI D-PHY with the TLVDS/ELVDS types, you need to emulate MIPI HS and MIPI LP by using LVDS25(E)+LVCMOS12 and need to add external resistors.

Some GW1NR FPGAs support the MIPI IO type. The MIPI IO has an internal resistor network and supports automatic switching between HS and LP. The support list of the MIPI IO type is shown in Table 2-9.

For information on IO type selection and off-chip termination, please refer to “4 Functional Description” in [IPUG948, Gowin MIPI D-PHY RX TX Advance User Guide](#).

Table 2-9 List of GW1NR series of FPGA Products that Support MIPI IO Mode

MIPI Input/Output	GW1NR-2	GW1NR-9
MIPI Input	Bank2(with dynamic ODT)	Bank0(with dynamic ODT)
MIPI Output	Bank0/3/4/5(with dynamic ODT)	Bank2

The key features of the soft MIPI D-PHY RX/TX include:

- High Speed RX and TX at up to 4.8Gbps
- Supports up to 4 data lanes and 1 clock lane
- Supports multiple PHYs(if there are enough IOs available)
- Supports bidirectional low-power (LP) mode
- Supports MIPI DSI and MIPI CSI-2 link layers
- Supports built-in HS Sync, bit and lane alignment
- Supports MIPI D-PHY RX 1:8 and 1:16 deserialization modes
- Supports IO Types of ELVDS, TLVDS, MIPI IO, etc
- Bank0/2 of GW1NR-9 support I3C

For more information, see [IPUG948, Gowin MIPI D-PHY RX TX Advance IP User Guide](#).

2.9 Clocks

The clock resources and wiring are critical for high-performance applications in FPGA. The GW1NR series of FPGA products provide global clocks (GCLKs) which connect to all the registers directly. In addition, high-speed clocks (HCLKs), PLLs, etc. are provided.

For more information on the GCLKs, HCLKs, PLLs, see [UG286, Gowin Clock User Guide](#).

2.9.1 Global Clocks

The Global Clock(GCLK) resources are distributed as quadrants in the GW1NR devices, with each quadrant providing eight GCLKs. The clock sources of GCLKs include dedicated clock input pins and CRUs, and better clock performance can be achieved by using the dedicated clock input pins.

2.9.2 PLLs

The PLL (Phase-locked Loop) is one kind of feedback control circuit. The frequency and phase of the internal oscillator signal are controlled by the external input reference clock.

PLLs in the GW1NR series of FPGA products can provide synthesizable clock frequencies. Frequency adjustment (multiplication and division), phase adjustment, and duty cycle adjustment can be achieved by configuring the parameters.

2.9.3 High-speed Clocks

The high-speed clocks (HCLKs) can support high-performance data transmission of I/Os and are mainly suitable for source synchronous data transfer protocols, see Figure 2-17, Figure 2-18, and Figure 2-19.

Figure 2-17 GW1NR-2 HCLK Distribution

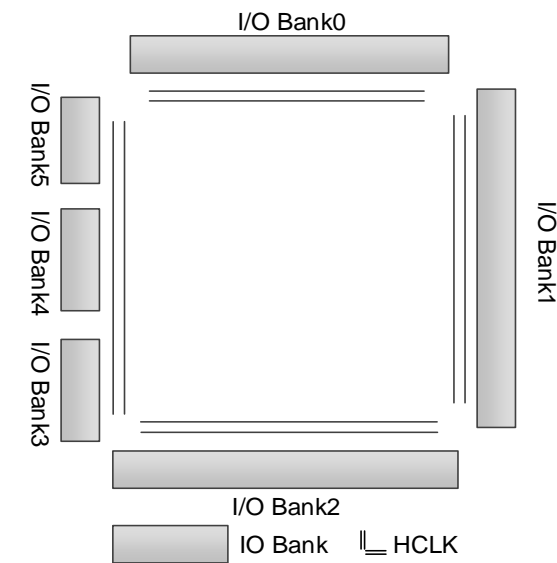

Figure 2-18 GW1NR-4 HCLK Distribution

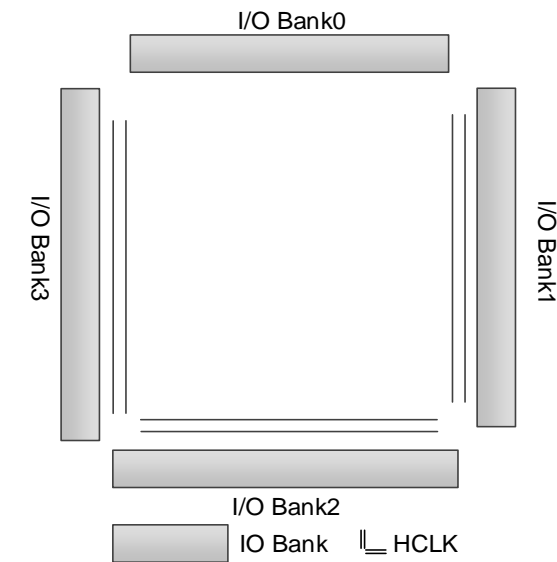

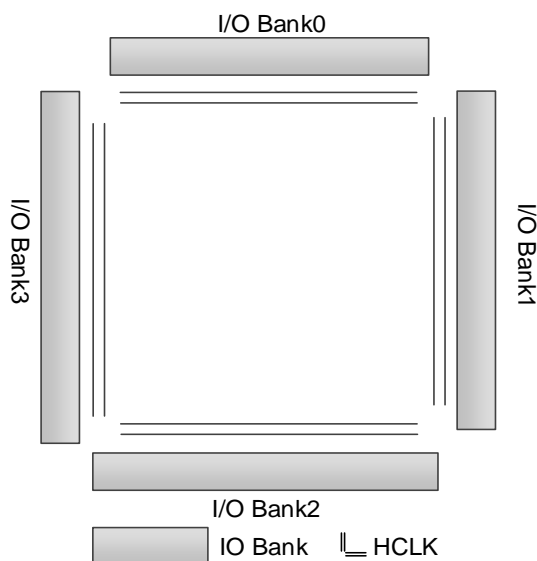

Figure 2-19 GW1NR-9 HCLK Distribution

2.10 Long Wires

As a supplement to the CRU, the GW1NR series of FPGA products provide another kind of routing resource - the long wire, which can be used for clock, clock enable, set/reset, or other high fan out signals.

2.11 Global Set/Reset

The GW1NR series of FPGA products offer a dedicated global set/reset (GSR) network that connects directly to the device's internal logic and can be used as asynchronous/synchronous set or asynchronous/synchronous reset, with the registers in the CFUs and I/Os being able to be configured independently.

2.12 Programming & Configuration

The GW1NR series of FPGA products support SRAM configuration and Flash programming. Flash programming includes on-chip Flash programming and off-chip Flash programming. The GW1NR series of FPGA products(Automotive) support DUAL BOOT, allowing you to back up data to the off-chip Flash as needed.

Besides JTAG, the GW1NR series of FPGA products also support Gowin's own GowinCONFIG configuration mode: AUTO BOOT, SSPI, MSPI, DUAL BOOT, SERIAL, and CPU. All the devices support JTAG mode and AUTO BOOT mode. For more information, please refer to [UG290, Gowin FPGA Products Programming and Configuration User Guide](#).

2.12.1 SRAM Configuration

If SRAM configuration is used, the configuration data needs to be re-downloaded after each power-up.

2.12.2 Flash programming

The Flash programming data is stored in the on-chip Flash. Each time the device is powered up, the configuration data is transferred from the Flash to the SRAM. Configuration can be completed within a few milliseconds after power-up, which is why this kind of configuration is also known as "instant on".

The GW1NR series of FPGA products support the feature of background upgrade. That is to say, you can program the on-chip Flash or off-chip Flash via the JTAG^[1] interface without affecting the current working state. During programming, the device works according to the previous configuration. After the programming is completed, trigger RECONFIG_N with a low level to complete the upgrade. This feature is suitable for the applications requiring long online time and irregular upgrades.

Note!

- [1] GW1NR-2 can support the I²C background upgrade by using the goConfig I2C IP. It is recommended to use the JTAG interface to implement the background upgrade.
- [2] As a configuration pin, RECONFIG_N is an input pin with internal weak pull-up, but as a GPIO, RECONFIG_N can only be used for output. For more information, please refer to [UG290, Gowin FPGA Products Programming and Configuration User Guide](#).

In addition, the GW1NR series of FPGA products support off-chip Flash programming and DUAL BOOT. For more information, please refer to [UG290, Gowin FPGA Products Programming and Configuration User Guide](#).

2.13 On-chip Oscillator

The GW1NR series of FPGA products have an embedded programmable on-chip clock oscillator which provides a clock source for the MSPI configuration mode.

The on-chip oscillator also provides a clock resource for user designs. Up to 64 clock frequencies can be obtained by setting the parameters.

The following formula is used to get the output clock frequency of the on-chip oscillator of GW1NR-4: $f_{out}=210\text{MHz}/\text{Param}$.

GW1NR-2/9 Device The following formula is used to get the output clock frequency: $f_{out}=250\text{MHz}/\text{Param}$.

Note!

- "Param" should be even numbers from 2 to 128.

Table 2-10 and Table 2-11 list some frequencies provided by the on-chip oscillator.

T _{JCOM}	Junction temperature for commercial operations	0°C	+85°C
T _{JIND}	Junction temperature for industrial operations	-40°C	+100°C

Note!

- ^[1] If the hard MIPI D-PHY is not used, you can leave the V_{CCD} and V_{CCIOD} pins floating, or connect them to a 1.2V supply.
- For some packages, V_{CCIO} and V_{CCX} may share the same pin. In this case, V_{CCX} requirements must be met first.
- The allowable ripples on V_{CC}, V_{CCIO}, and V_{CCX} are 3%, 5%, and 5% respectively. For devices of which the PLL is powered directly with V_{CC}, the ripple on V_{CC} can affect the jitter characteristics of the PLL output clock; 2). The ripple on V_{CCIO} can eventually be passed on to the output waveform of the IO Buffer.
- For more information on the power supplies, please refer to [UG805, GW1NR-2 Pinout](#), [UG116, GW1NR-4 Pinout](#), and [UG803, GW1NR-9 Pinout](#).

3.1.3 Power Supply Ramp Rates

Table 3-3 Power Supply Ramp Rates

Name	Description	Min.	Typ.	Max.
V _{CC} Ramp	Power supply ramp rates for V _{CC}	0.6mV/μs	-	6mV/μs

V _{CCIO} Ramp	Power supply ramp rates for V _{CCIO}	0.1mV/μs	-	10mV/us

Note!

- A monotonic ramp is required for all power supplies.

- All power supplies need to be in the operating range as defined in Table 3-2 before configuration. Power supplies that are not in the operating range need to be adjusted to a faster ramp rate, or you have to delay configuration.

Note!

- ^[1] These test values are based on integer frequency division.
- ^[2] In cascade mode, multiple dividers can be connected in series to obtain a lower output frequency.
- ^[3] The output jitter is related to the input source. These test values are based on the case where a low-jitter crystal oscillator is used as the input source.

- ^[4] The duty cycle on the IO is also affected by the clock tree.

3.5 User Flash Characteristics

3.5.1 DC Characteristics

($T_J = -40 \sim +100^\circ\text{C}$, $V_{CC} = 1.08 \sim 1.32\text{V}$, $V_{CCX} = 1.62 \sim 3.63\text{V}$, $V_{SS} = 0\text{V}$)

Table 3-22 User Flash DC Characteristics^{[1],[4]}

		$V_{CC}^{[3]}$	V_{CCX}			
Read mode(w/l 25ns)	$I_{CC1}^{[2]}$	2.19	0.5	mA	NA	Minimum clock period, 100% duty cycle, $V_{IN} = "1/0"$
Write mode		0.1	12	mA	NA	
Erase mode		0.1	12	mA	NA	
Page erase mode		0.1	12	mA	NA	
Static read current (25-50ns)	I_{CC2}	980	25	μA	NA	$XE=YE=SE="1"$, between $T=T_{acc}$ and $T=50\text{ns}$, the I/O current is 0mA. After $T=50\text{ns}$, the internal timer turns off read mode, and the I/O current turns out to be the standby current.
Standby mode	I_{SB}	5.2	20	μA	0	V_{SS} , V_{CCX} , and V_{CC}

Note!

- ^[1] These values are average DC currents and the peak currents will be higher than these average currents.
- ^[2] I_{CC1} calculation in different cycle time of T_{new} .
 - $T_{new} < T_{acc}$: not allowed.
 - $T_{new} = T_{acc}$: see the table above.
 - $T_{acc} < T_{new} - 50\text{ns}$: $I_{CC1}(\text{new}) = (I_{CC1} - I_{CC2})(T_{acc}/T_{new}) + I_{CC2}$
 - $T_{new} > 50\text{ns}$: $I_{CC1}(\text{new}) = (I_{CC1} - I_{CC2})(T_{acc}/T_{new}) + 50\text{ns} \cdot I_{CC2}/T_{new} + I_{SB}$
 - $t > 50\text{ns}$: $I_{CC2} = I_{SB}$
- ^[3] V_{CC} must be greater than 1.08V from time zero of the wake-up time.
- ^[4] The leakage current of the Flash is included in the leakage current of the device, see Table 3-4.

	Negative pulse width of SE	T_{nws}	2	-	ns
	Recovery time	T_{rcv}	10	-	μs
	Data storage time	$T_{hv}^{[3]}$	-	6	ms
	Erase time	T_{erase}	100	120	ms
	Mass erase time	T_{me}	100	120	ms
	Wake-up time of power-down to standby	T_{wk_pd}	7	-	μs
	Standby hold time	T_{sbh}	100	-	ns
	V_{CC} setup time	T_{ps}	0	-	ns
	V_{CCX} hold time	T_{ph}	0	-	ns

Note!

- [1] The values are simulation data and are subject to change.
- [2] After XADR, YADR, XE, and YE are valid, T_{acc} starts at the rising edge of SE. DOUT will be kept before the next valid read operation starts.
- [3] T_{hv} is the cumulative high voltage programming time to the same row before next erase. The same address cannot be programmed (either “0” or “1”) more than 2 times before the next erase and the same bit-cell can't be programmed (“0”) more than 2 times before the next erase. The program behavior is limited based on above constraints of whichever is satisfied first.
- [4] All waveforms have a 1ns rising time and a 1ns falling time.
- [5] Control signals(X, YADR, XE, and YE) need to be held for at least T_{acc} , which starts at the rising edge of SE.

3.6 Configuration Interface Timing Specification

The GW1NR series of FPGA products support seven GowinCONFIG modes: AUTO BOOT, SSPI, MSPI, DUAL BOOT, SERIAL, and CPU. For more information, please refer to [UG290, Gowin FPGA Products Programming and Configuration User Guide](#).

4 Ordering Information

4.1 Part Naming

Note!

- For more information about the packages, please refer to [1.2 Product Resources](#) and [1.3 Package Information](#).
- The LittleBee family devices and Arora family devices of the same speed grade have different speeds.
- Both “C” and “I” are used in Gowin’s part name marking for one device. GOWIN devices are screened using industrial standards, so the same device can be used for both industrial (I) and commercial (C) applications. The maximum temperature of the industrial grade is 100°C, and the maximum temperature of the commercial grade is 85°C. Therefore, if the chip meets speed grade 7 in commercial grade applications, its speed grade will be 6 in industrial grade applications.

4.2 Package Markings

Gowin's devices have markings on the their surfaces, as shown in Figure 4-3.

Figure 4-3 Package Marking Examples

Note!

- [1] The first two lines in the right figure(s) above are both the “Part Number”.
- [2] The fifth character of the Date Code denotes the version of the device.
- [3] Whether the package marking bears the Gowin Logo or not depends on the package type, package size, and Part Number length. The above figure are only examples of the package markings.

5 About This Guide

5.1 Purpose

This data sheet describes the features, resources, architecture, AC/DC characteristics, and ordering information of the GW1NR series of FPGA products, making it easier to understand and use Gowin's devices.

5.3 Terminology and Abbreviations

The terminology and abbreviations used in this manual are shown in Table 5-1.

Table 5-1 Terminology and Abbreviations

Terminology and Abbreviations	Full Name
ALU	Arithmetic Logic Unit
BSRAM	Block Static Random Access Memory
CFU	Configurable Function Unit
CLS	Configurable Logic Section
CRU	Configurable Routing Unit
DCS	Dynamic Clock Selector
DP	True Dual Port 16K BSRAM
DQCE	Dynamic Quadrant Clock Enable
DSP	Digital Signal Processing
EQ	ELQFP
FN	QFN
FPGA	Field Programmable Gate Array
GPIO	Gowin Programmable IO
IOB	Input/Output Block
LQ	LQFP
LUT4	4-input Look-up Table
MG	MBGA
MIPI	Mobile Industry Processor Interface
PLL	Phase-locked Loop
PSRAM	Pseudo Static Random Access Memory
QN	QFN
REG	Register
SDP	Semi Dual Port 16K BSRAM

Terminology and Abbreviations	Full Name
SDRAM	Synchronous Dynamic RAM
SIP	System in Package
SP	Single Port 16K BSRAM
SSRAM	Shadow Static Random Access Memory
